

Machine Learning in Cardiac Imaging

Andrew King

School of Biomedical Engineering and Imaging Sciences
King's College London

Outline

LEARNING FROM CLINICIANS

1. Incorporating non-imaging data into image-based machine learning
2. Exploiting multi-modal imaging data

MACHINE LEARNING IN ACQUISITION/RECONSTRUCTION/ANALYSIS

3. Automated quality control in large-scale imaging databases
4. Machine learning for robust MR reconstruction

Learning from cardiologists

How do doctors make clinical decisions?

1. Incorporating non-imaging data into image-based machine learning

Background

- Cardiac resynchronisation therapy (CRT) involves implanting a pacemaker to treat heart failure
- Using standard clinical selection criteria, ~30% of patients do not respond to treatment
- Research in the clinical literature has identified specific activation patterns that are associated with CRT response*, but these require manual inspection of imaging data by expert cardiologists

Aim

- Use machine learning to automatically learn imaging/non-imaging features to predict positive CRT response

* **Sohal et al., JACC, 2013; Jackson et al, Heart Rhythm 2014**

Data

Database:

34 patients selected for CRT

Pre-treatment tagged/cine/LGE MR

Follow-up data (positive/negative response to treatment)

Non-imaging data:

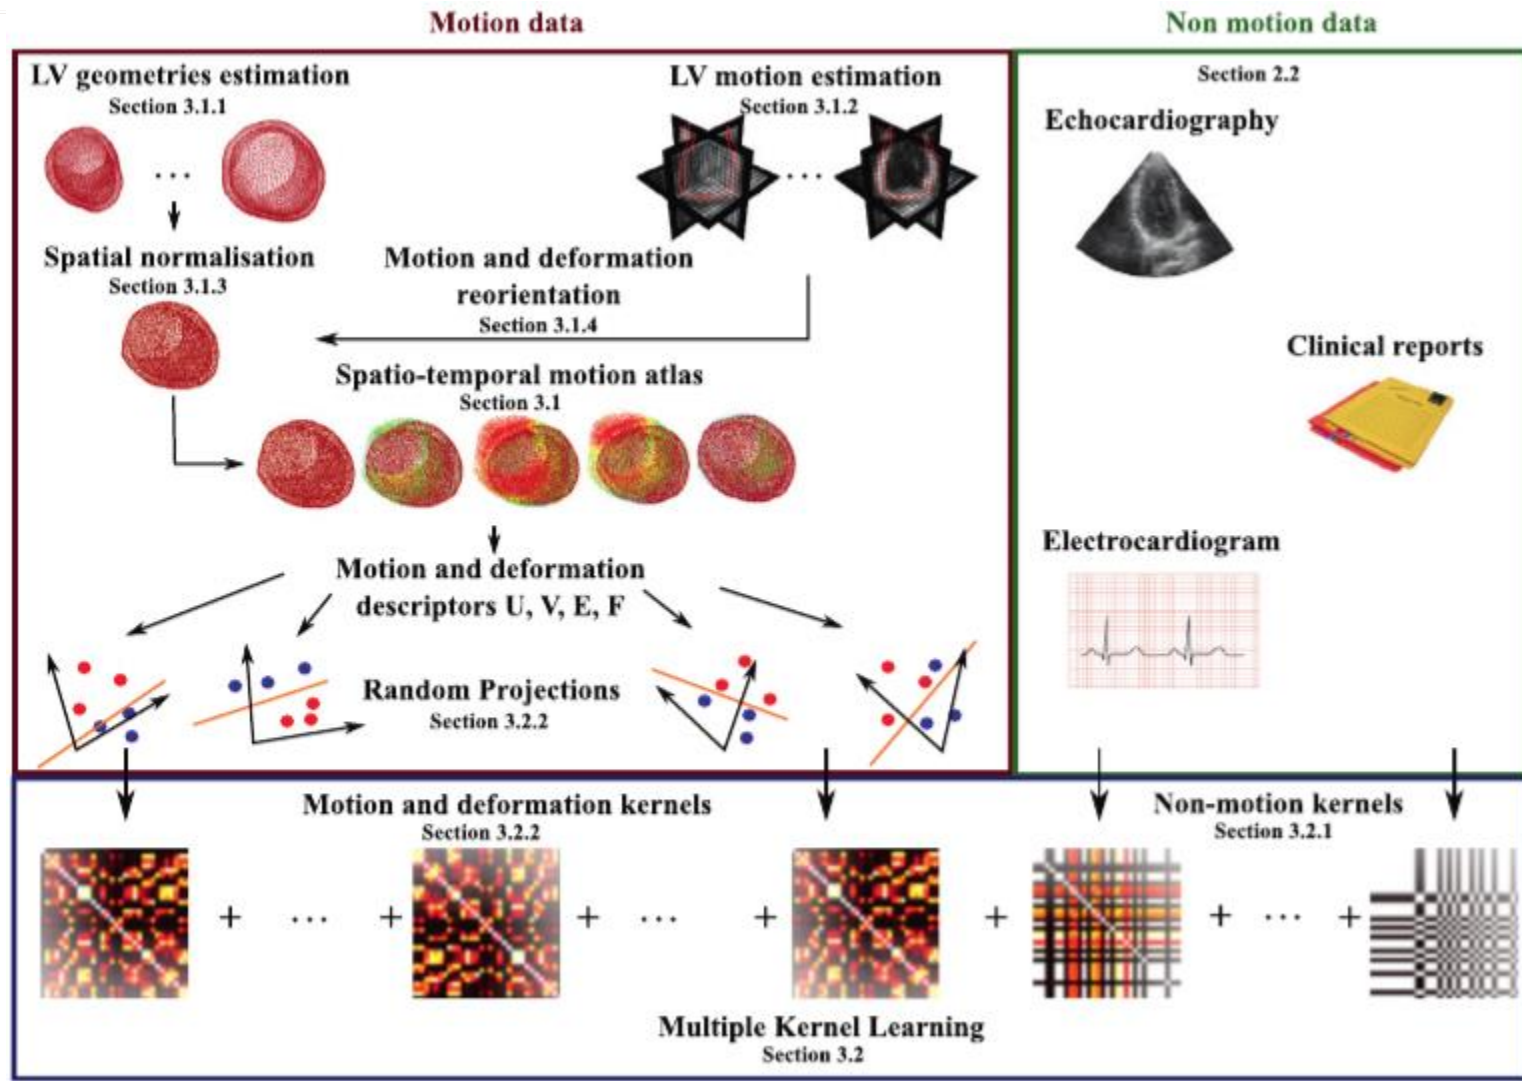

Table 1

Description of the non-motion data derived from the clinical evaluation of the patient, from the ECG analysis and from 2D echocardiography imaging. For continuous data values, the third column reports mean and standard deviation over the entire cohort, while for categorical (binary) data values, the fourth column reports the counts of the corresponding categories.

Biomarker	Description	Mean/std dev	Frequency
<i>Aetiology</i>	Ischaemic/non-ischaemic	NA	13/21
<i>EDV_m</i>	End-Diastolic Volume from 3D geometry (cm^3)	281/127	NA
<i>EDV</i>	End-Diastolic Volume from 2D echo (cm^3)	214/91	NA
<i>ESV</i>	End-Systolic Volume from 2D echo (cm^3)	164/84	NA
<i>EF</i>	Ejection Fraction from 2D echo (%)	24.7/9.3	NA
<i>Gender</i>	Male/Female	NA	24/10
<i>LBBB</i>	Strict Left-Bundle Branch Block: yes/no	NA	23/11
<i>NYHA</i>	New York Heart Association classes (I-IV)	2.7/0.5	NA
<i>QOL</i>	Quality of Life questionnaire score	48/27	NA
<i>QRS_d</i>	QRS duration (ms)	146/22	NA
<i>QRS_{cat}</i>	QRS category < 150 ms/ > 150 ms	NA	18/16
<i>Rhythm</i>	Sinus/Atrial fibrillation	NA	28/6
<i>6MWD</i>	6 min walking distance (m)	269/137	NA

Multiple kernel learning for CRT response prediction - results

Classification results:

	Non-motion kernels only	Motion kernels only	Both motion and non-motion kernels
Accuracy	85.3	88.2	91.2
Sensitivity	100	100	100
Specificity	37.5	50	62.5
PPV	83.8	86.7	89.7
NPV	100	100	100

Sensitivity = proportion of responders chosen for treatment

Specificity = proportion of non-responders who would not be chosen for treatment

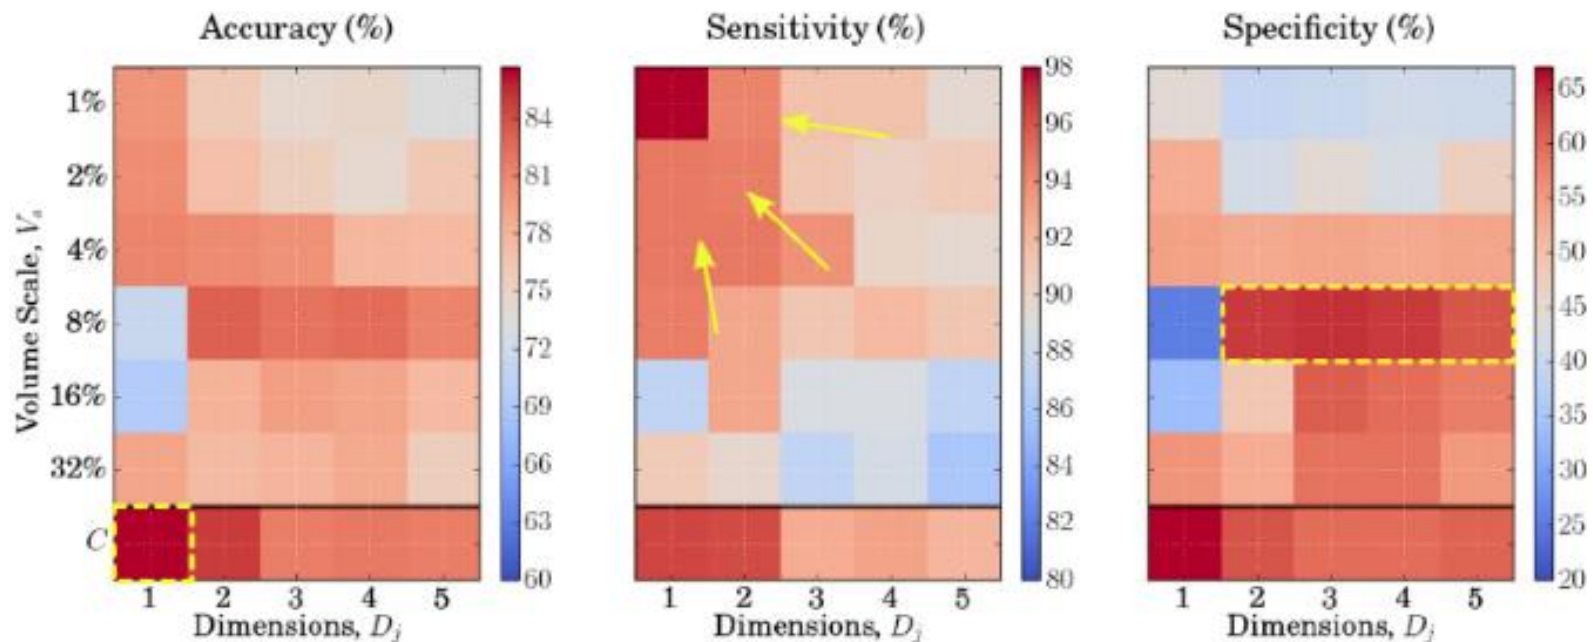

Multiple kernel learning for CRT response prediction – kernel weights

Experience

2. Exploiting multi-modal imaging data

Background:

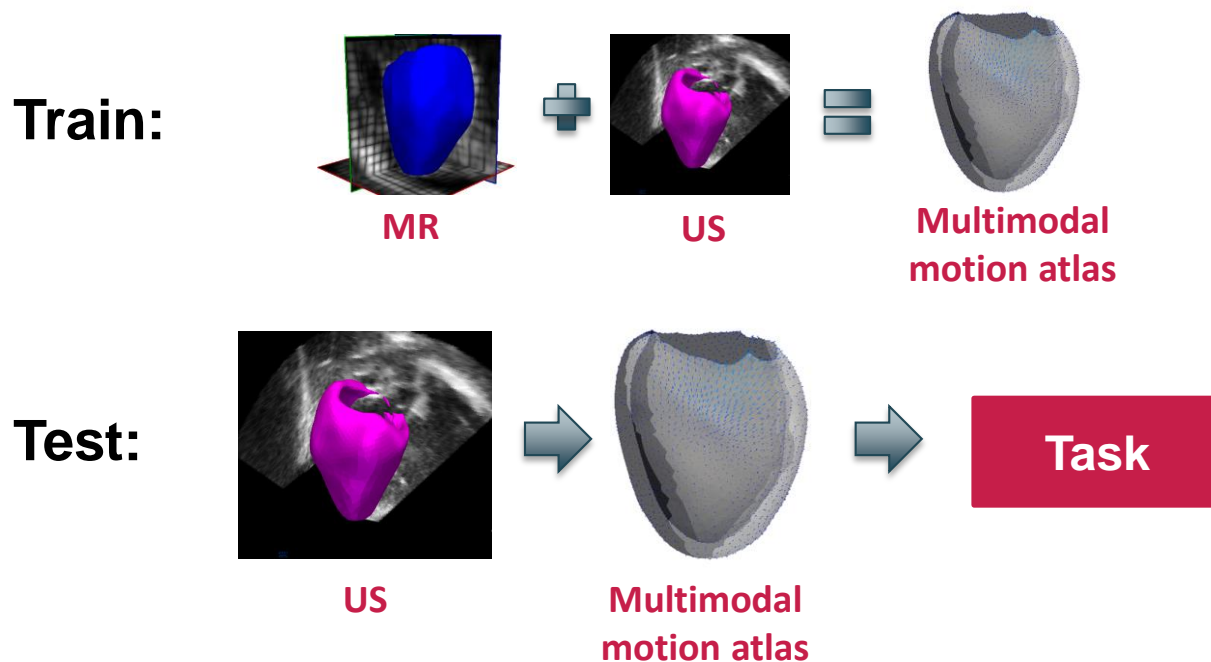

- MR is considered to be the 'gold standard' for cardiac functional assessment
- US is more commonly used due to its low cost, ease of use and portability

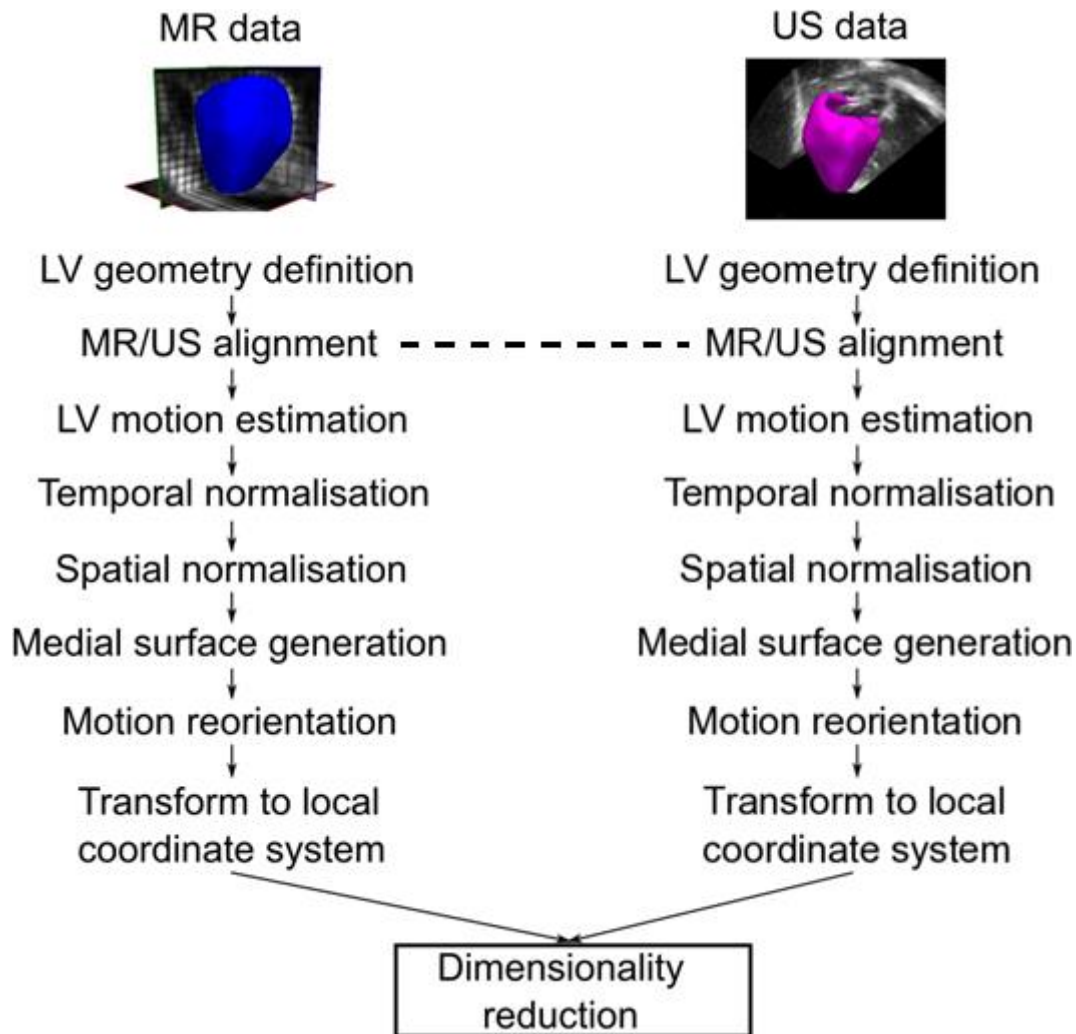

Exploiting multi-modal imaging data

Aim:

- Use a database of paired MR/US data sets to exploit multimodal data in a diagnostic pipeline
- Pipeline should be based on data from a single modality (US)

A multimodal cardiac motion atlas

Puyol-Anton et al., Med Image Anal, 2017

A. King – Machine Learning in Cardiac Imaging

Multiview dimensionality reduction

Multi-view dimensionality reduction algorithms

- *Canonical correlation analysis (CCA)* on MR/US displacements
 - Determines directions where X and Y have maximum *correlation* between modalities
- *Partial least squares regression (PLS)* on MR/US displacements
 - Determines directions where X and Y have maximum *covariance* between modalities

Single view dimensionality reduction algorithm

- *Principal component analysis (PCA)* on MR displacements only
 - Determines directions of maximum data *variance* in single modality

Multimodal atlas: results

- CCA and PLS have lower errors than PCA.

- PLS has lower errors and better reconstructed volumes compared to CCA.

$E_d(\text{MR-US})$ – embedding error

$E_D(\text{MR-MR})$ – Reconstruction error for MR

$E_D(\text{US-US})$ – Reconstruction error for US

$E_D(\text{MR-US})$ – Prediction error

The task

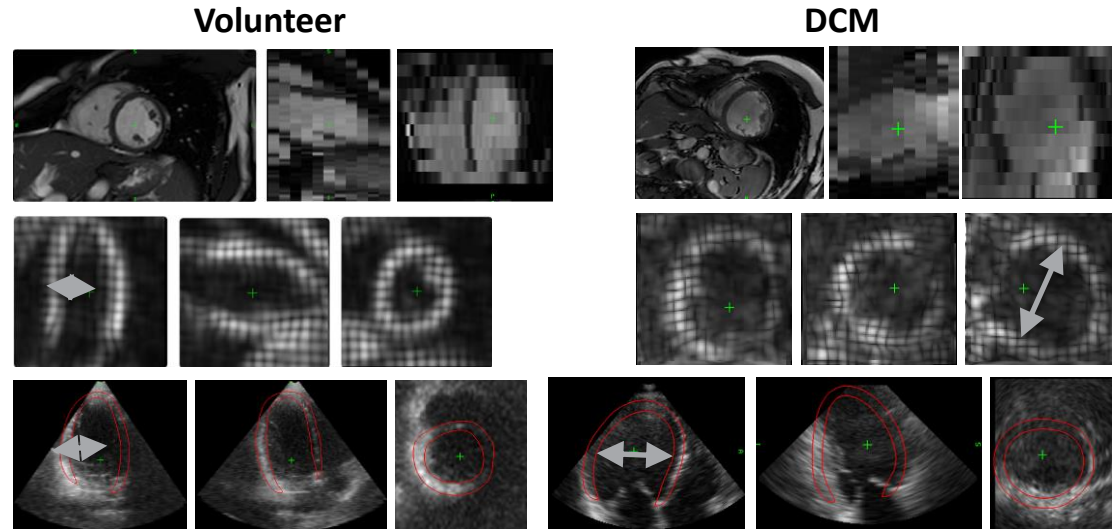

Classification of normal vs. dilated cardiomyopathy:

Clinical database:

- 50 healthy volunteers
- 14 dilated cardiomyopathy patients

Image protocol (LV):

- Multi-slice short-axis MR sequence
- 3D tagged MR sequence (3DTAG).
- 3D apical ultrasound sequence (3DUS).

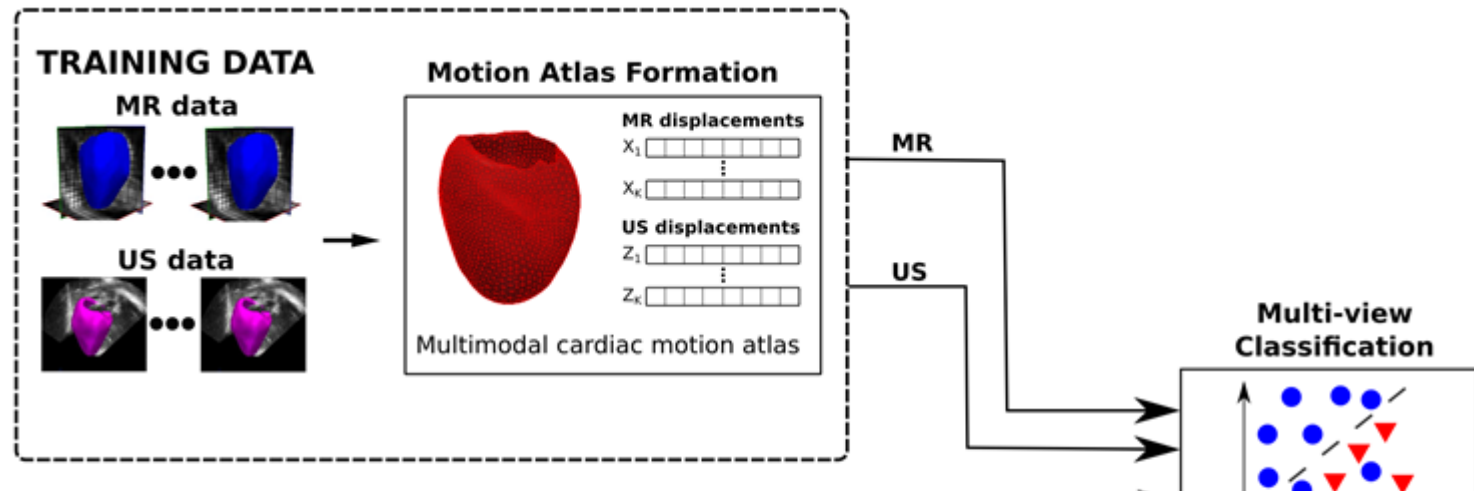

Stratified k-fold cross-validation

- Imbalanced data
- # low dimensions set to retain 90% of the variance
- 8 folds and 100 repetitions

Puyol-Anton et al., IEEE Trans Biomed Eng, 2018

Multiview classification

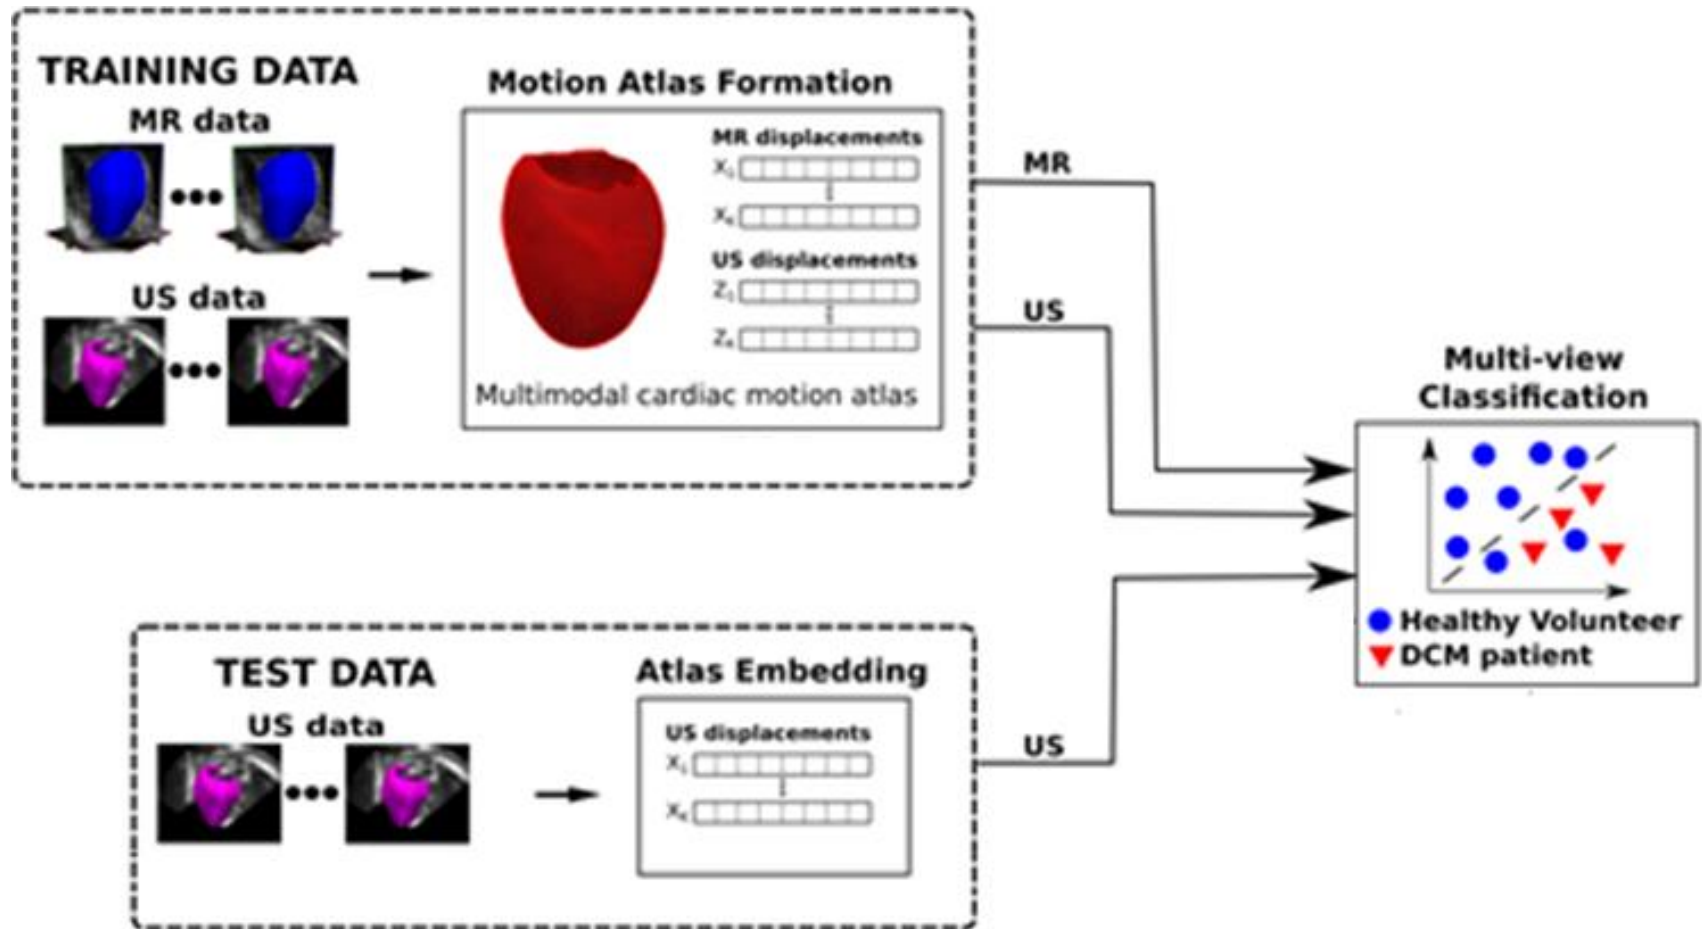

2.a. Single modality US method

$\text{PCA}_{\text{US}} + \text{LDA}$	74.79 (15.8)	71.05 (28.6)	78.57 (10.1)
$\text{PCA}_{\text{US}} + \text{SVM}_{\text{rbf}}$	87.32 (12.9)	84.50 (23.2)	90.14 (6.6)

3. Multiple modality two-step method

$\text{PLS} + \text{LDA}$	80.07 (16.8)*	75.51 (27.1)	81.86 (9.5)
$\text{PLS} + \text{SVM}_{\text{rbf}}$	90.39 (12.1)*	87.50 (21.8)	90.57 (10.9)

Multiview learning

Puyol-Anton et al., IEEE Trans Biomed Eng, 2018

A. King – Machine Learning in Cardiac Imaging

Multiview learning

1. Multiple modality one-step method

3. Multiple modality two-step method

2. Single modality methods

2.a- Baseline - US-only

2.b- MR-only

Multiview learning - results

Proposed method	BACC (%)	SEN (%)	SPE (%)
<i>1. Multiple modality one-step method</i>			
MLDA	82.18 (15.0)*	80.50 (26.5)	83.86 (9.9)
MvLapSVM	92.71 (10.4)*	89.00 (20.8)	95.14 (6.8)
Comparative approaches	BACC (%)	SEN (%)	SPE (%)
<i>2.a. Single modality US method</i>			
PCA _{US} + LDA	74.79 (15.8)	71.05 (28.6)	78.57 (10.1)
PCA _{US} + SVM _{rbf}	87.32 (12.9)	84.50 (23.2)	90.14 (6.6)
<i>2.b. Single modality MR method:</i>			
PCA _{MR} + LDA	84.21 (15.4)*	74.00 (28.8)	90.43 (6.8)
PCA _{MR} + SVM _{rbf}	90.89 (11.7)*	86.50 (22.3)	95.29 (6.7)
<i>3. Multiple modality two-step method</i>			
PLS + LDA	80.07 (16.8)*	75.51 (27.1)	81.86 (9.5)
PLS + SVM _{rbf}	90.39 (12.1)*	87.50 (21.8)	90.57 (10.9)

- One-step multiview learning outperforms two-step approach

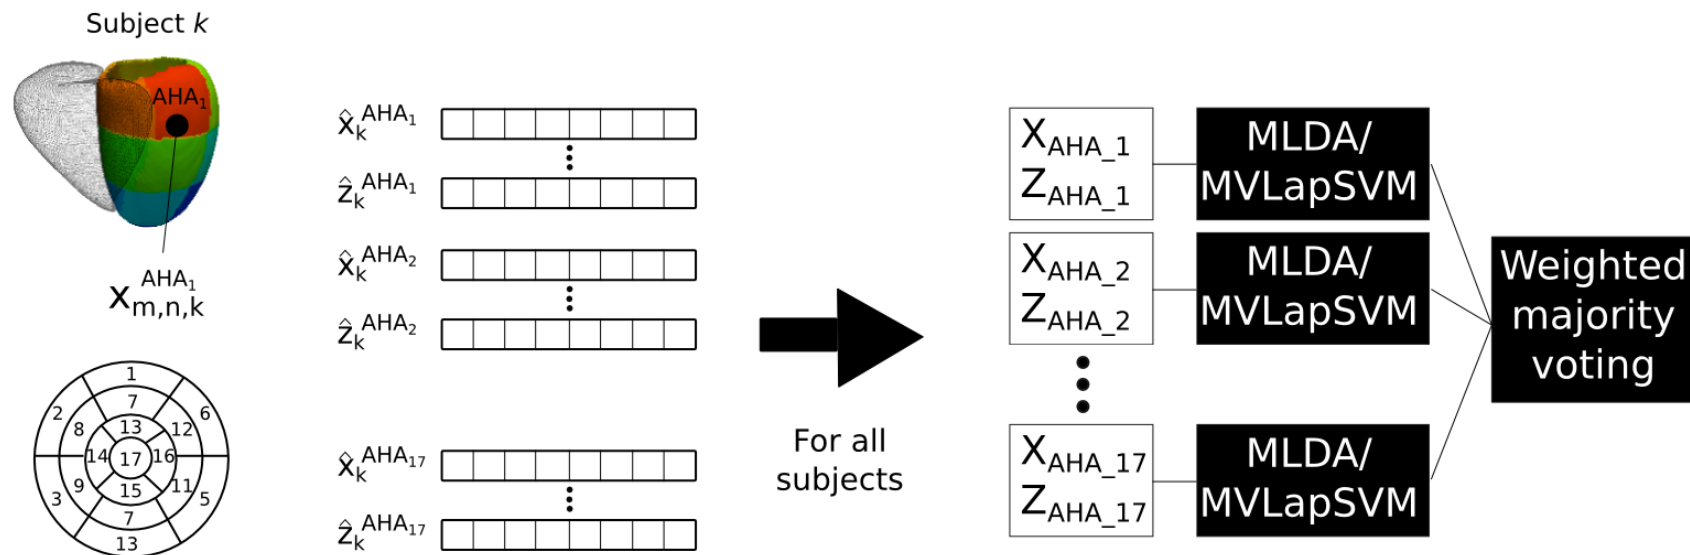

- One-step multiview learning performs almost as well as the 'gold standard' of MR-based classification

BACC: balanced accuracy
SEN: sensitivity
SPE specificity

* Student's t-test
(99% confidence)

Puyol-Anton et al., IEEE Trans Biomed Eng, 2018

Regional multiview learning

Weighted majority voting:

For each AHA segment each subject is classified. The results are combined using weighted majority voting with weights determined at training by a randomised search on hyper parameters

Puyol-Anton et al., IEEE Trans Biomed Eng, 2018

A. King – Machine Learning in Cardiac Imaging

Regional multiview learning - results

Global Methods	BACC (%)	SEN (%)	SPE (%)
MLDA	82.18 (15.0)	80.50 (26.5)	83.86 (9.9)
MvLapSVM	92.71 (10.4)	89.00 (20.8)	95.14 (6.8)
Regional Methods	BACC (%)	SEN (%)	SPE (%)
MLDA	87.71 (12.6)*	85.00 (23.1)	90.43 (6.7)
MvLapSVM	94.32 (11.1)*	93.00 (17.5)	96.57 (6.2)

- Regional approach has higher accuracy
- Highest accuracy was 94% using regional MvLapSVM.

BACC: balanced accuracy
SEN: sensitivity
SPEL specificity

* Student's t-test
(99% confidence)

Puyol-Anton et al., IEEE Trans Biomed Eng, 2018

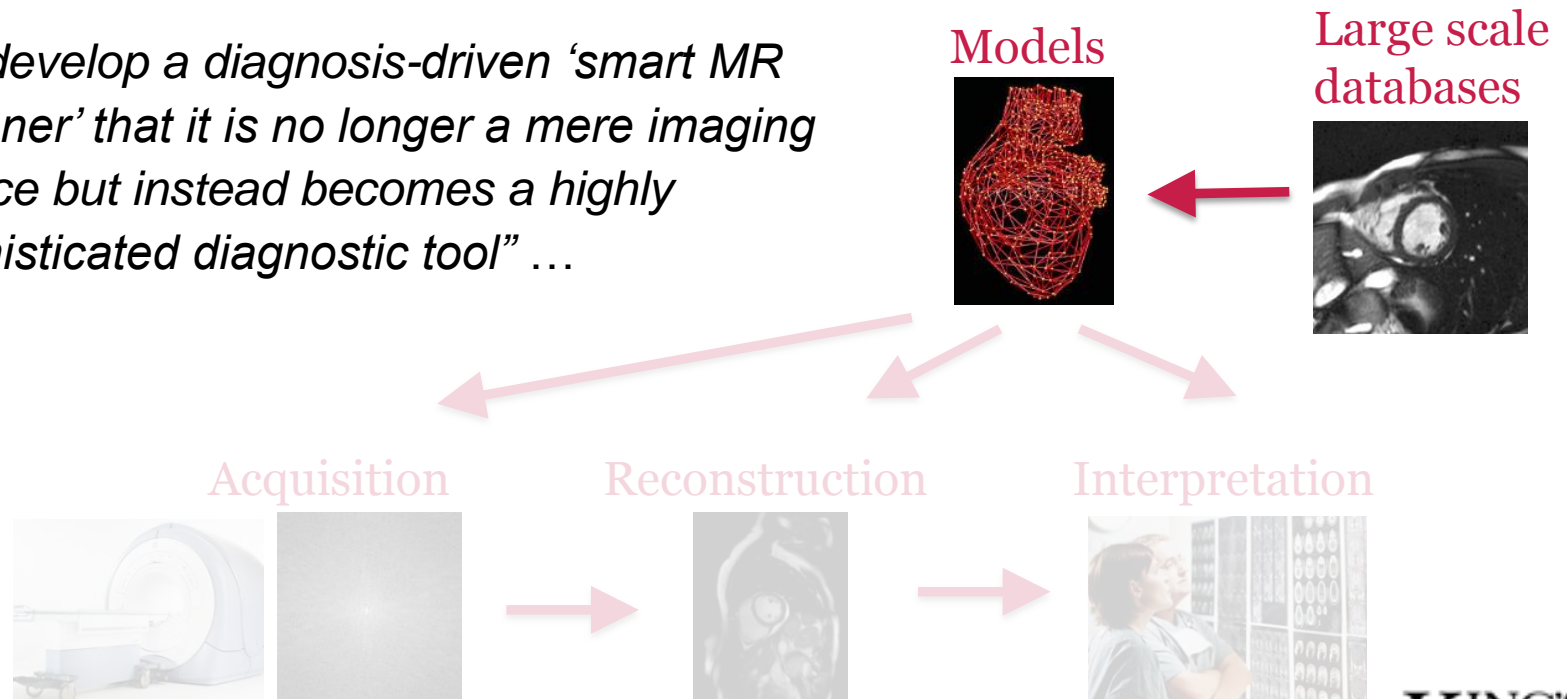

SmartHeart project

5 year grant involving:

3. Automated quality control in large-scale imaging databases

Cardiac MR

Adopted from Ferreira et al., JCMR, 2013.

- Need for high quality images
- Wide range of artefacts
- Manual labelling tedious for large datasets
- Need for automatic quality assessment tools

- UK Biobank is a large scale database of imaging/non-imaging data
- Will eventually consist of cardiac MR images from 100,000 subjects (currently ~27,000)

Cardiac MR quality issues

1. Off-axis (4ch)*

- Left Ventricular Outflow Tract
- 5 chamber look

2. Motion related artefacts (SAX)\$

- Breathing
- Mis-triggering
- Arrhythmia

Good Planning

Bad Planning

Good Quality

Motion Artefact

* Oksuz et al., ISBI 2018

\$ Oksuz et al., MICCAI 2018

4-chamber cine cardiac MR

- Good 4-chamber CMR image shows all chambers clearly, enables right and left atrium analysis
- Planned using 2-chamber and short axis images
- Mistakes in planning lead to 'off axis' images

2-chamber view

Short axis view

4-chamber view

Oksuz et al., ISBI 2018

A. King – Machine Learning in Cardiac Imaging

Left ventricular outflow tract (LVOT)

- Off-axis acquisitions often show the Left Ventricular Outflow Tract (LVOT)
- Challenges RA and LA analysis
- Automatic LVOT detection can assist automatic quality control/planning

Good Planning

Bad Planning

Oksuz et al., ISBI 2018

A. King – Machine Learning in Cardiac Imaging

Method

1. Contrast Normalisation
2. Region of Interest Extraction
3. Training a CNN Model

Input: 2D 4chamber cardiac MR

ROI

2D Dataset

CNN Model for Learning

Output: LVOT= 0 or 1

- Similar to Lenet* Model
- Dropout 0.5 after each layer
- ReLU Activation

Oksuz et al., ISBI 2018

*** LeCun et al., Proc IEEE, 1998**

Experimental results

Dataset:

- 123 Good Quality Image and 123 LVOT images from UK Biobank
- 5 temporal frames of each sequence, 615 images for each class

Methods	Accuracy	Precision	Recall
K-Nearest Neighbours	0.613	0.604	0.602
Linear SVM	0.732	0.741	0.736
Decision Tree	0.651	0.626	0.619
Random Forests	0.598	0.613	0.610
Adaboost	0.718	0.729	0.727
Naive Bayesian	0.653	0.625	0.637
Discriminant Analysis	0.669	0.684	0.643
CNN w.o Augmentation	0.801	0.811	0.781
CNN	0.826	0.828	0.821

$$\text{Accuracy} = \frac{TP + TN}{TP + FP + FN + TN}$$

$$\text{Precision} = \frac{TP}{TP + FP}$$

$$\text{Recall} = \frac{TP}{TP + FN}$$

Mistriggering

Good Quality

Oksuz et al., MICCAI 2018

A. King – Machine Learning in Cardiac Imaging

Data imbalance

1. More data

- Difficult task in many medical imaging applications.
- Not plausible to generate more real low quality medical data.

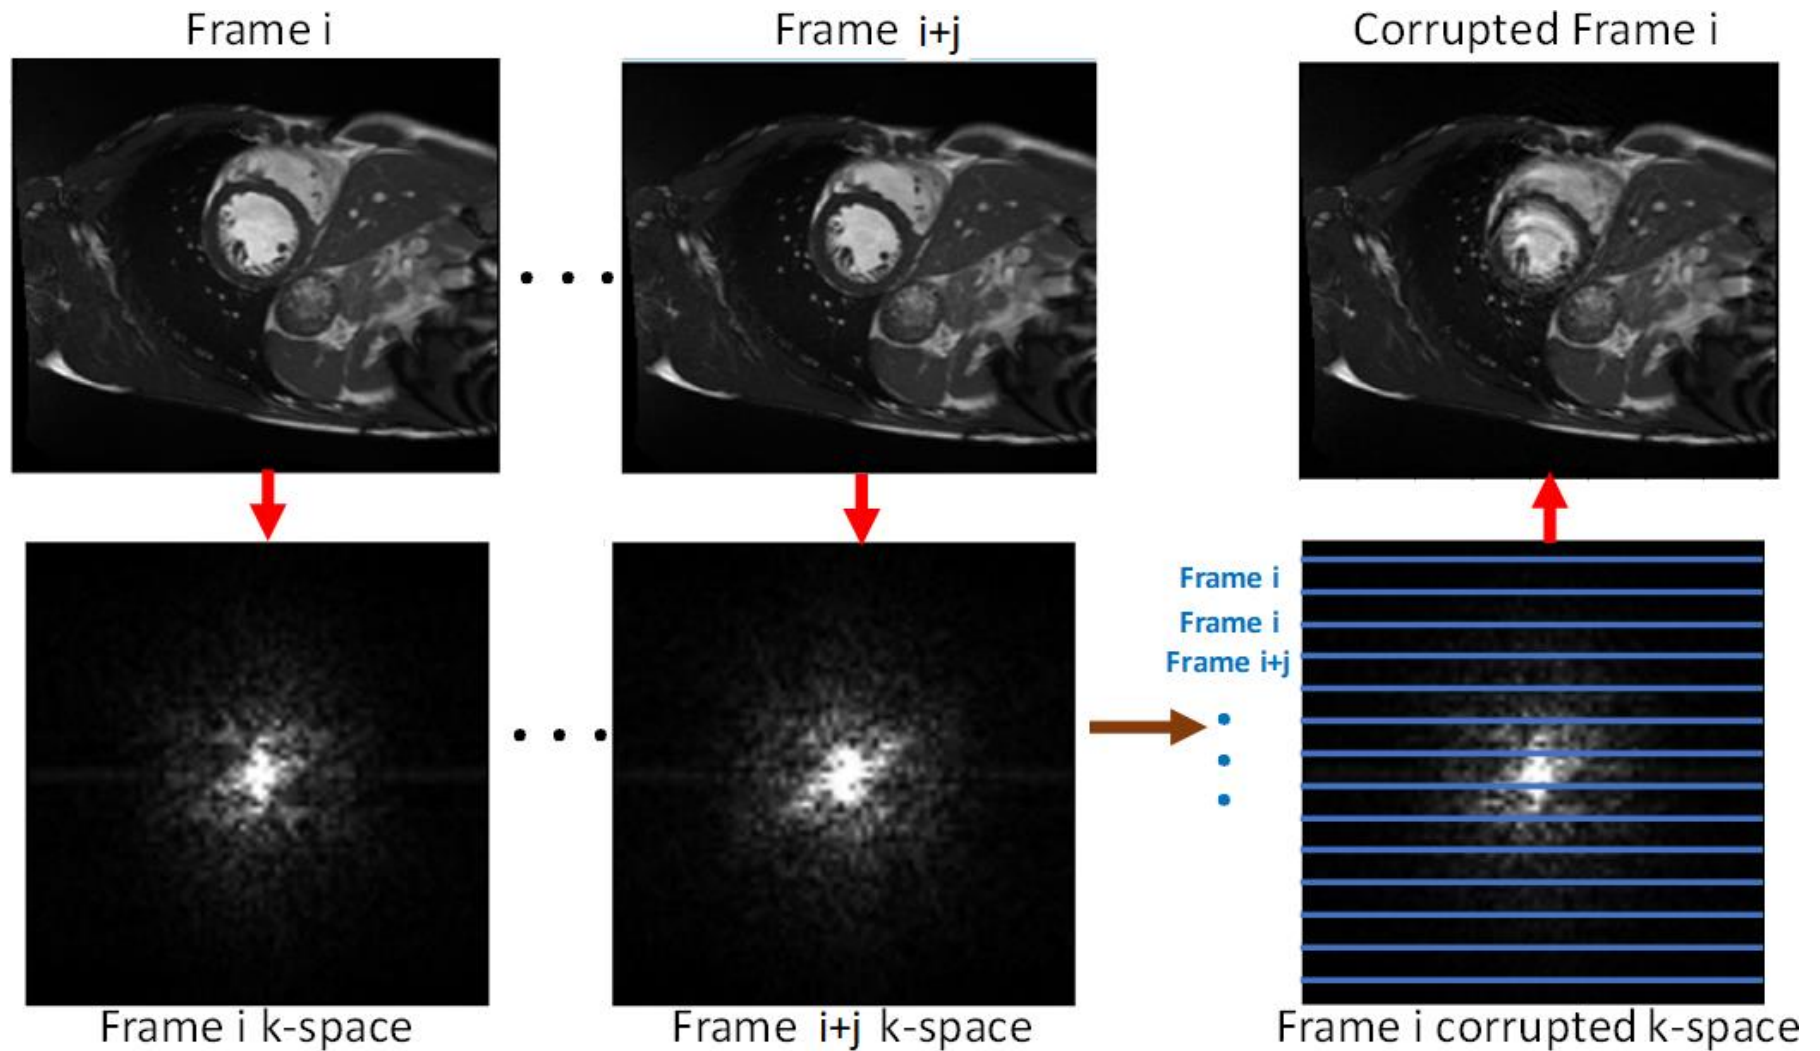

2. Resampling dataset

- Add copies of instances from the under-represented class.
- Delete some data from the over-represented class.

3. Generate synthetic samples

- Generate synthetic examples that best represent the original data from the under-represented class.

4. Machine learning for robust MR reconstruction

Aim:

MR motion artefact correction during reconstruction

Approaches:

- Denoising in image space (c to a)
- Denoising in k-space (d to b)
- **End-to-end (d to a)***

(a) Good quality image

(b) Good quality k-space

(c) Corrupted image

(d) Corrupted k-space

Oksuz et al., MICCAI MLMIR, 2018

A. King – Machine Learning in Cardiac Imaging

Automap

Image reconstruction by domain transform manifold learning

- Developed for high quality image reconstruction from under-sampled k-space
- Insufficient image quality for corrupted k-space

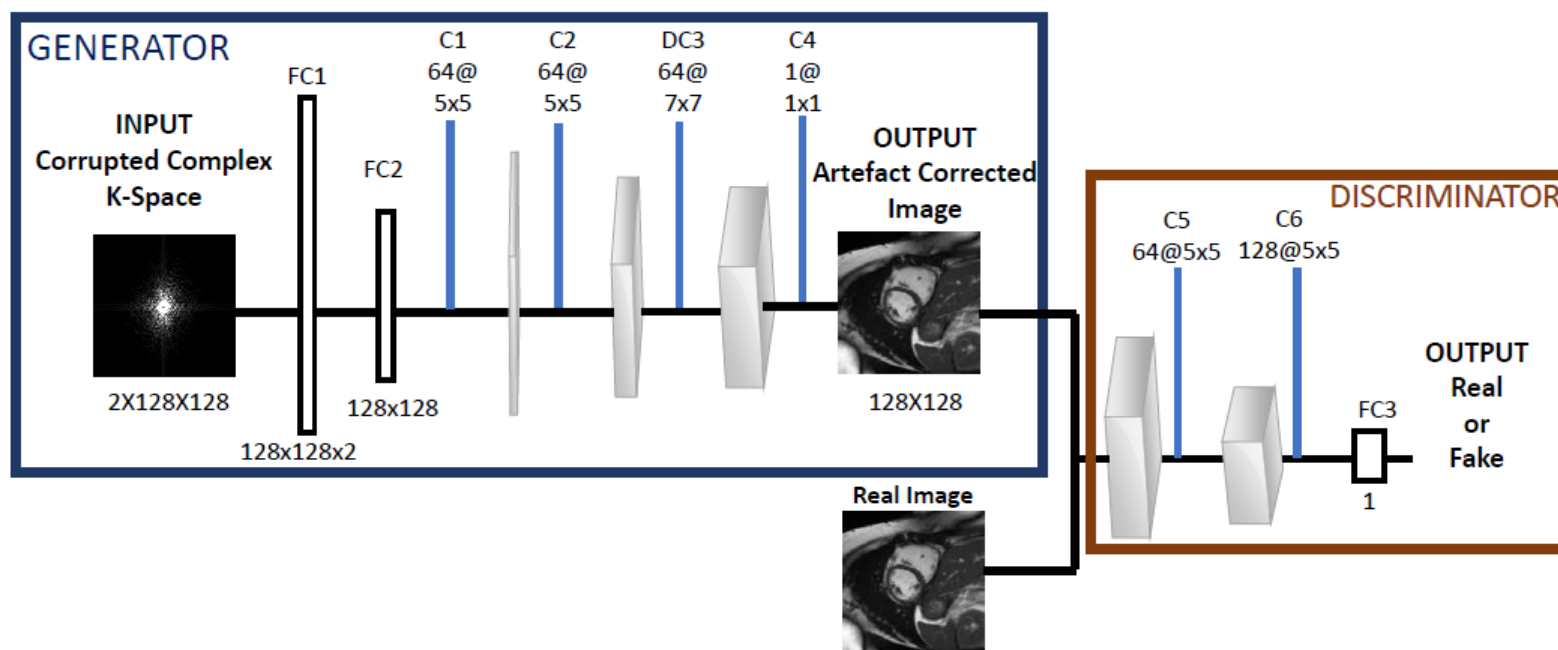

Oksuz et al., MICCAI MLMIR, 2018

* Zhu et al., Nature, 2018

Automap-GAN setup

Adversarial setup for motion artefact correction

- Improved robustness and deblurring of the image outputs

Experimental results

Dataset:

- Synthetically generated corruptions
- 75000 2D images for training, 2500 for testing

Methods	RMSE	PSNR	SSIM
Inverse Fourier Transform	0.045	27.8	0.883
Proposed-ImageNET	0.032	31.1	0.766
Automap-Cardiac	0.029	32.7	0.814
Proposed-Cardiac	0.027	35.1	0.850

$$\text{RMSE} = \sqrt{\frac{1}{N_x N_y} \sum_{x=0}^{N_x} \sum_{y=0}^{N_y} (r(x, y) - p(x, y))^2}$$

$$\text{PSNR} = 20 \log_{10} \left(\frac{\sum_{x=0}^{N_x} \sum_{y=0}^{N_y} r(x, y)^2}{\sqrt{\sum_{x=0}^{N_x} \sum_{y=0}^{N_y} (r(x, y) - p(x, y))^2}} \right)$$

$$\text{SSIM}(x, y) = \frac{(2\mu_x \mu_y + c_1)(2\sigma_{xy} + c_2)}{(\mu_x^2 + \mu_y^2 + c_1)(\sigma_x^2 + \sigma_y^2 + c_2)}$$
